

JOBU grafting clip

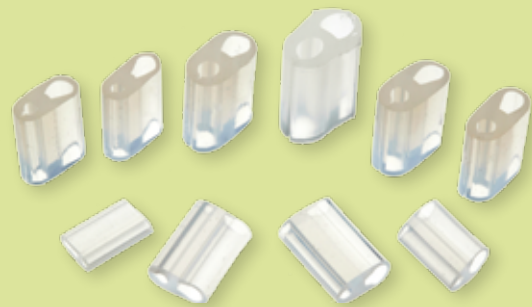

The JOBU grafting clip: when certainty counts!

JOBU grafting clips are used for the top grafting of vegetable plants and are made of top-quality silicon. Their transparency makes it easy to see the grafting point. And their flexibility allows a perfect seal around the grafting point.

The JOBU grafting clip is secured as follows:

1. Pick up the trimmed rootstock
2. With the other hand, place the grafting clip halfway over the rootstock
3. Then insert the trimmed scion into the grafting clip, so that it makes complete contact with the rootstock

JOBU grafting clips are used for the top grafting of many vegetable crops. This is already being done on at a very large scale for tomato and aubergine. They are also being used very successfully for cucumber, melon, courgette and watermelon. The first promising steps have also been taken for sweet pepper.

JOBU grafting clips: for successful grafting!

JOBU grafting clips are available in various models:

- standard model
